

Each person gets their own link and their own code

The option Lumina chose. Nobody is Cc'd, so one person's code can never open another person's copy of the report. Captured from the lumDev sandbox today.

The result: two people, one report, two separate emails. Chayim's code opened his copy. The same code was refused on James's copy, and the refusal is on the record with its IP address and time.

One report, two links, two different mailboxes

Both links point at the same report for the same facility and day. Each one names the only mailbox that can open it, so the page tells you up front where the code will go.

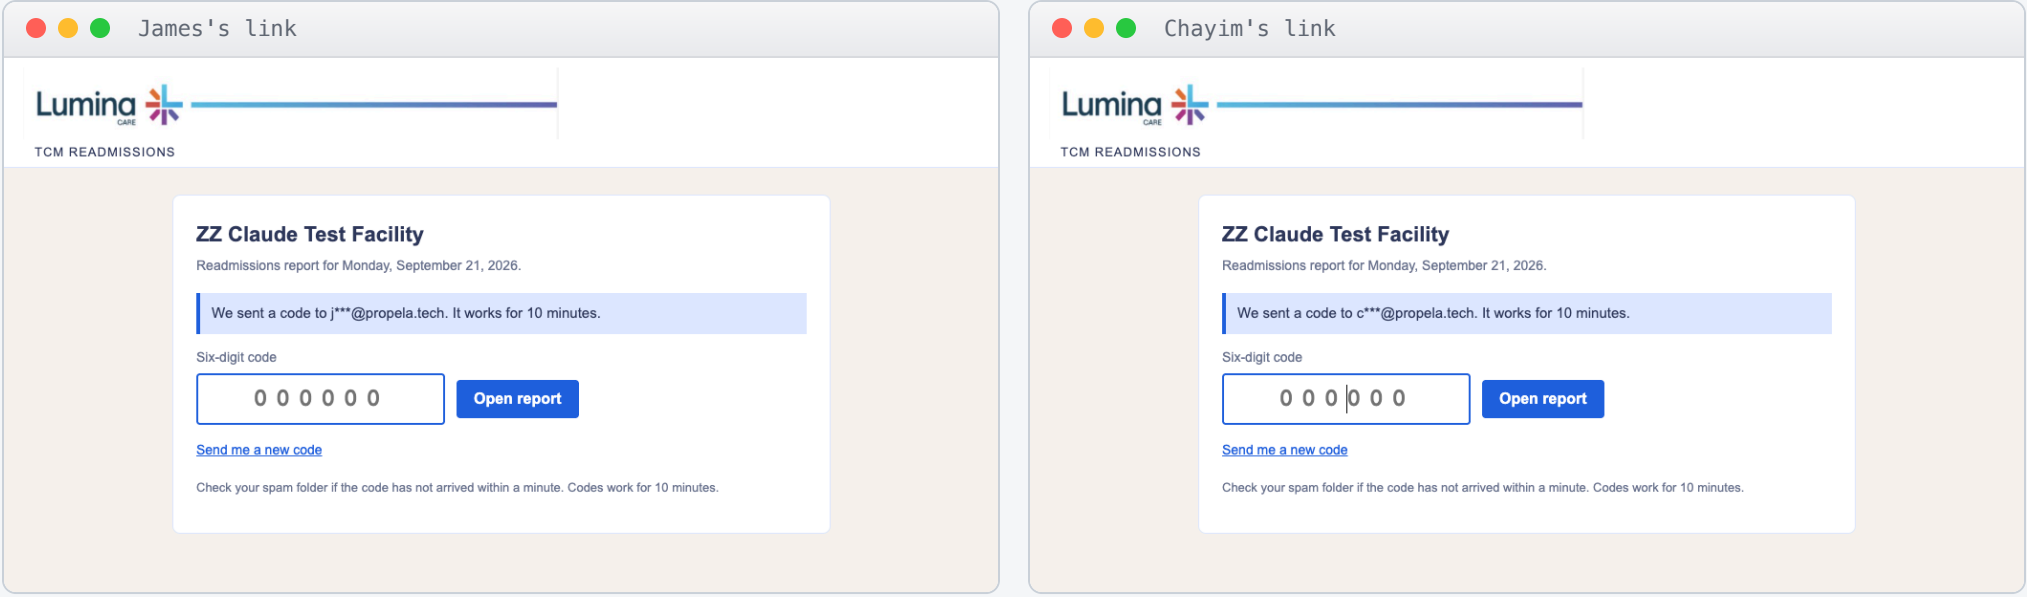

Says the code goes to j***@propela.tech.

Same report, but the code goes to c***@propela.tech.

Asking for a code sends it to that mailbox only

One click on each link. Two real emails went out, one to each address.

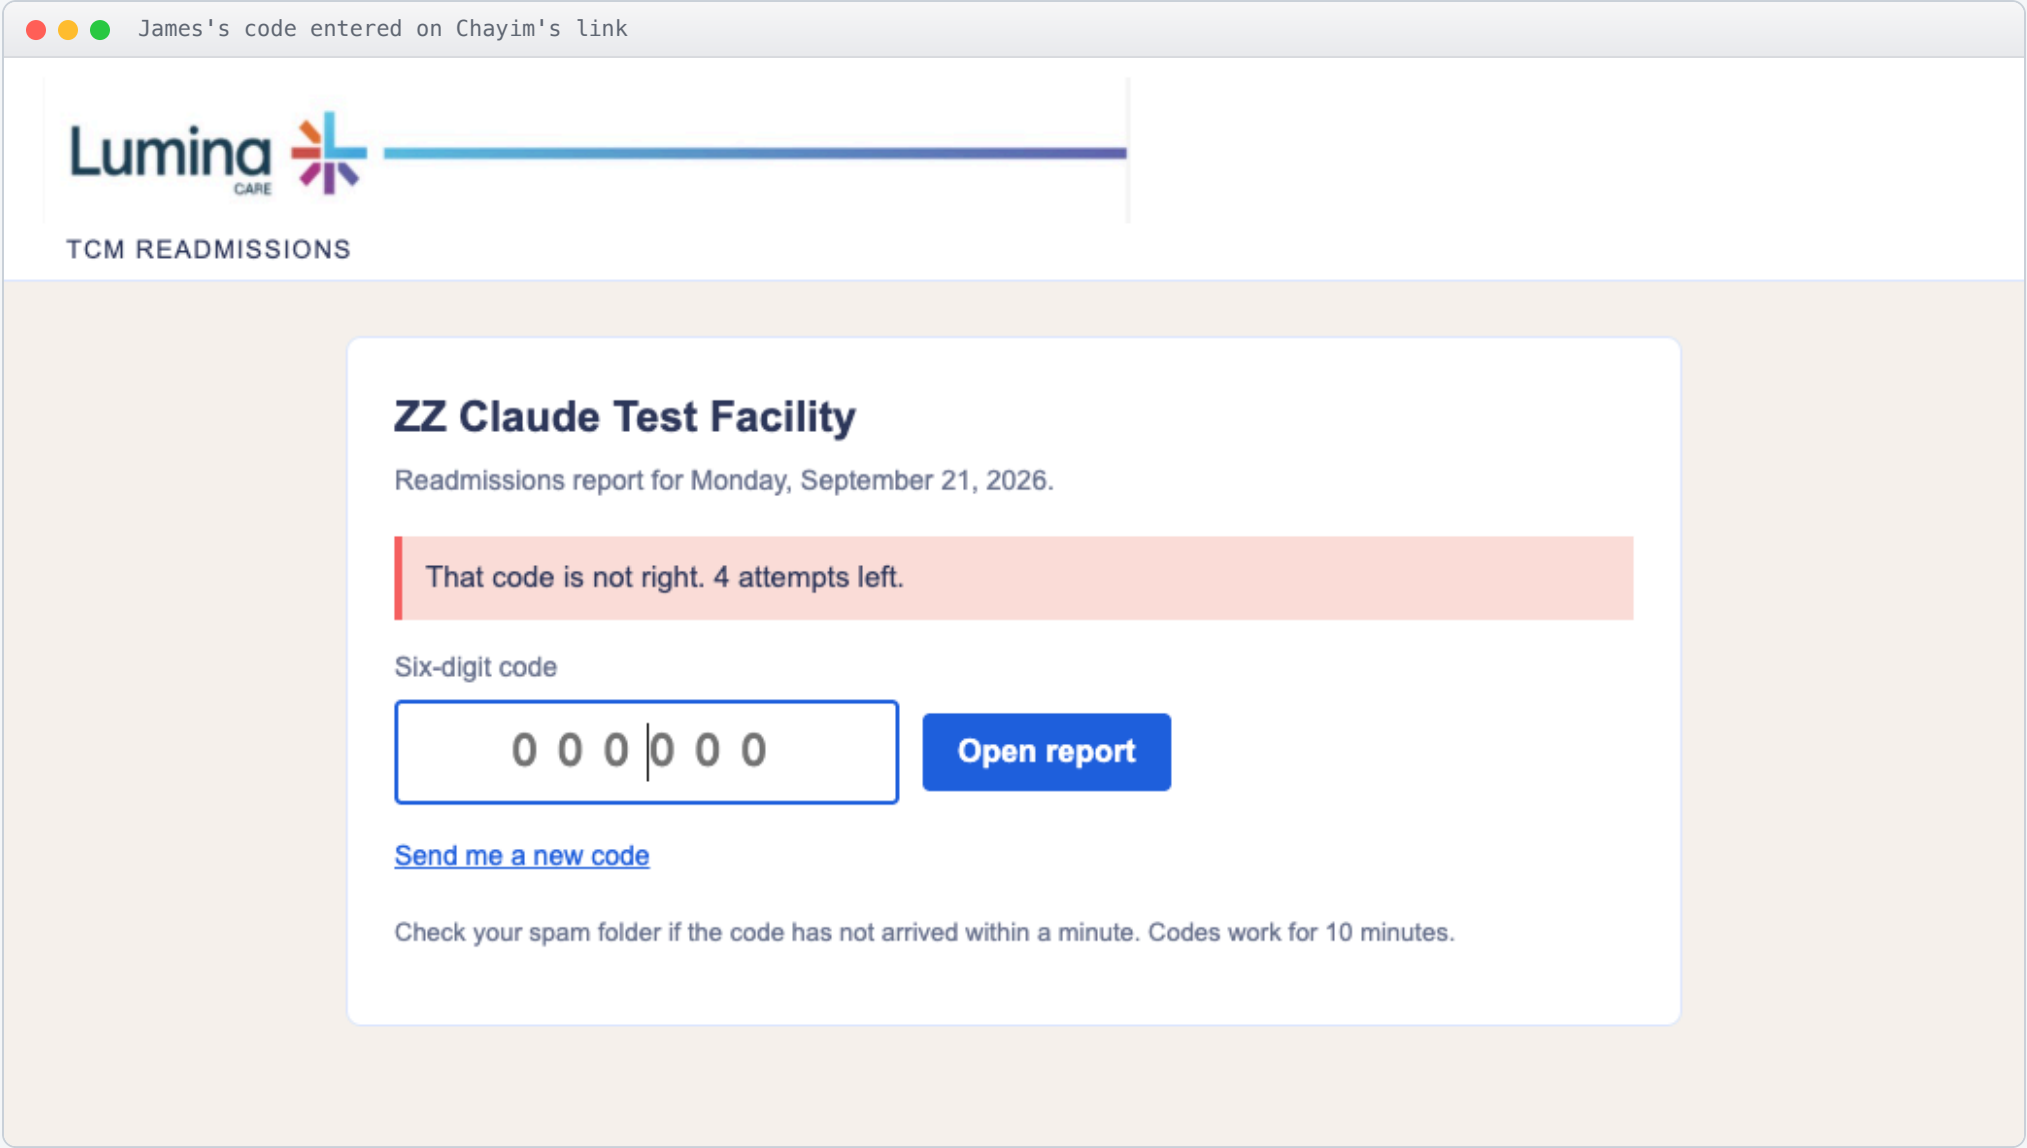

Code sent to James, good for 10 minutes.

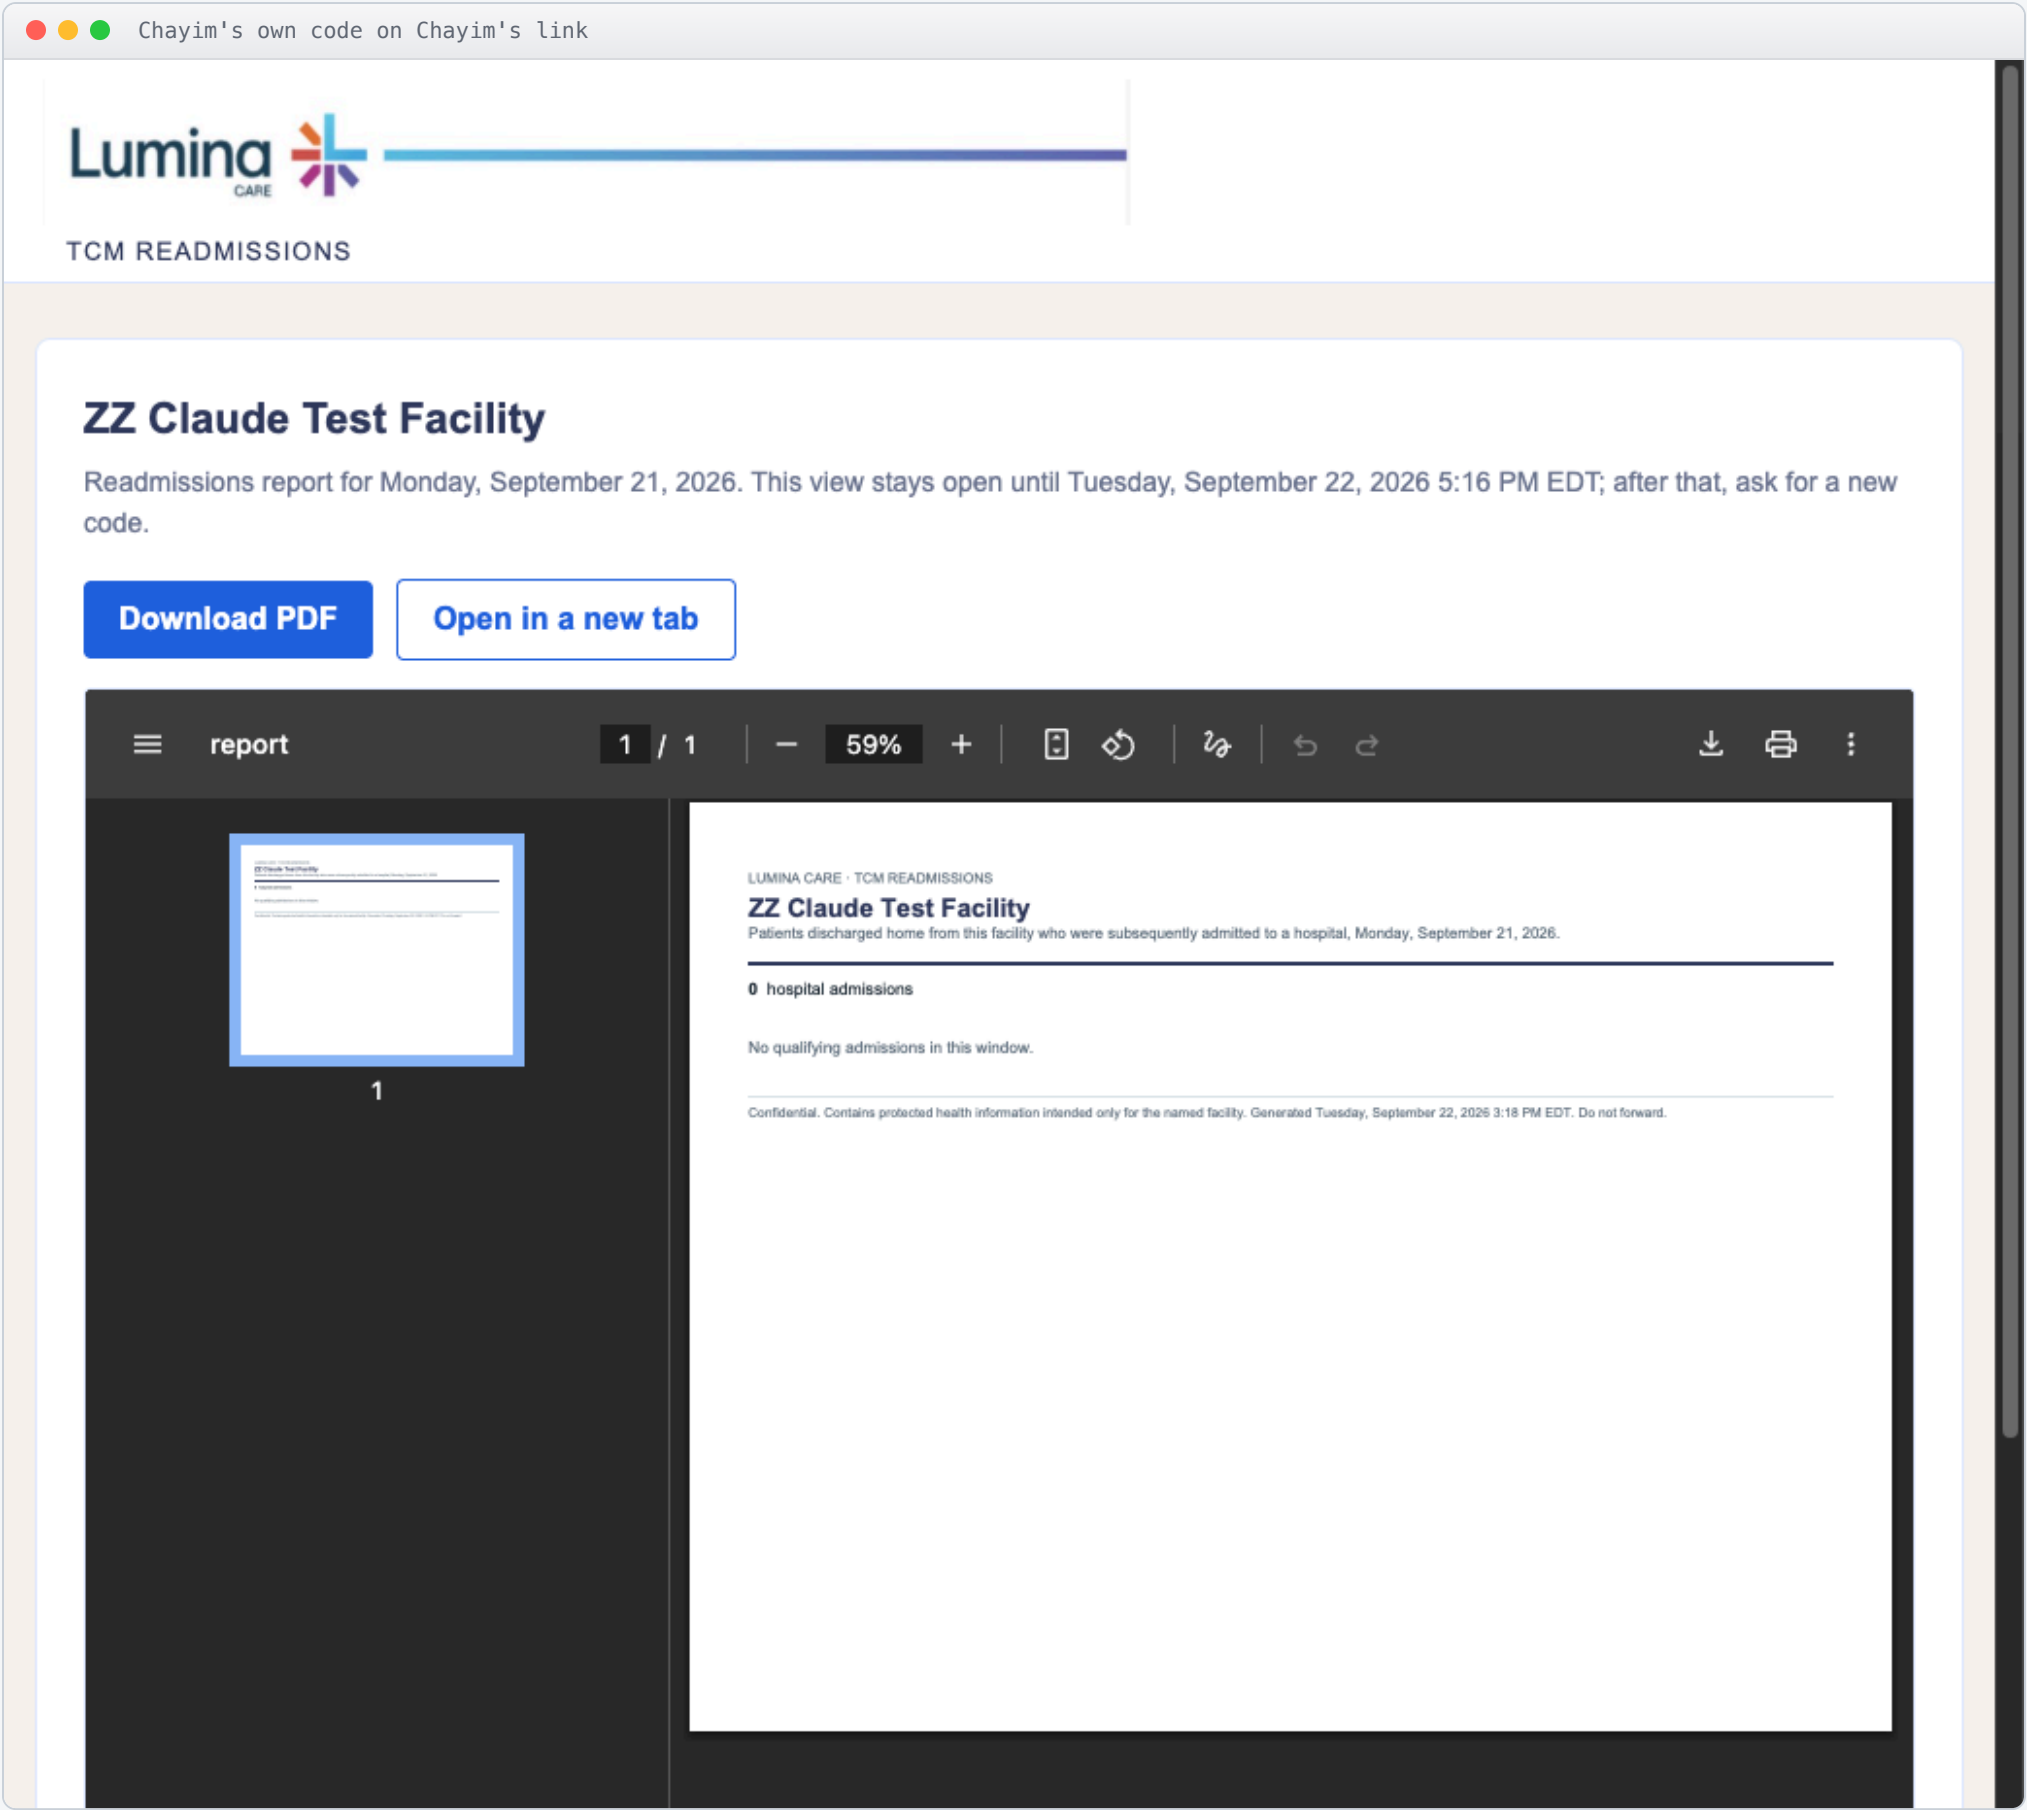

Code sent to Chayim, a different code.

The part that matters: a code only works on its own link

James's code was typed into Chayim's link. It was refused and counted as a failed attempt. Five wrong attempts lock the link for good.

Refused, and the page says how many attempts remain.

His own code opens the report. It stays open for 10 minutes, then needs a new code.

Every step is on the record

Written by the site itself, not by us. Lumina staff can read this on the link record at any time.

LINK ISSUED TO	EVENT	DETAIL	IP ADDRESS	TIME
james@propela.tech	Code sent	Code 1 of 10	213.194.158.31	21:05
chayim@propela.tech	Code sent	Code 1 of 10	213.194.158.31	21:05
chayim@propela.tech	Wrong code	Attempt 1 of 5	213.194.158.31	21:06
chayim@propela.tech	Opened	Open 1 of 10	213.194.158.31	21:06
chayim@propela.tech	PDF fetched		213.194.158.31	21:06

Both codes were genuinely emailed. The test inboxes are not ours to read, so for the refusal step each link's code was set to a known value first. Nothing else in the flow changed, and the stored value is the same scrambled form a real code produces.
